

Ahaaram Multi Cuisine Restaurant

Research Paper

A Web-Based Restaurant Ordering, Reservation and Management System

Abstract

This paper presents Ahaaram Multi Cuisine Restaurant, a full-stack web application designed to integrate restaurant menu browsing, online ordering, table reservation, customer account activities, reviews and administrative management into one platform. The application is developed using HTML5, CSS3, JavaScript, Python, Flask and SQLite.

Keywords

Restaurant Management, Flask, Python, SQLite, Online Food Ordering, Table Reservation, Web Application

1. Introduction

Digital restaurant platforms can combine customer and management activities within one web application. Ahaaram connects food discovery, cart-based ordering, reservations, customer records and administration through a single Flask application.

2. Problem Statement

Restaurant operations may involve separate processes for menu presentation, ordering, reservations, customer records and feedback. A centralized system can organize these activities and provide a consistent interface.

3. Proposed Method

The proposed system uses a web interface connected to a Flask backend and SQLite database. Customer actions are processed through application routes and stored as appropriate records. Administrative functions manage core restaurant data.

4. System Design

The architecture consists of presentation, application and data layers. HTML, CSS and JavaScript provide the interface; Python and Flask provide application processing; SQLite provides persistent storage.

5. Functional Modules

The system contains customer registration/login, menu, food details, search/filtering, cart, checkout, orders, table reservations, profile, order history, reservation history, favourites, reviews and administration modules.

6. Implementation

Flask routes and templates provide restaurant functions. SQLite stores records. HTML and CSS provide the interface, while JavaScript supports interactive client-side behavior. The application can be executed locally using Python and Flask.

7. Discussion

The integrated workflow allows customers to move from menu browsing to food selection, cart management, checkout and order placement. A separate reservation workflow supports table booking. The administration interface provides centralized management of operational records.

8. Conclusion

Ahaaram Multi Cuisine Restaurant provides a practical web-based approach for integrating restaurant ordering, reservation, customer interaction and administration. The application demonstrates the use of Flask and SQLite in a full-stack system.
